

GENETIC DEGRADATION

Lanthano

8/9/2022

<https://answersingenesis.org/genetics/hox-hype/>

“In very dark-skinned people groups, individuals carry **AABB** genes and only produce dark-skinned offspring. In very light-skinned people groups, individuals carry **aabb** genes and only produce light-skinned offspring. If a male and female from each group mate and produce a child, the combination of their **AABB** and **aabb** genes would give rise to a child who carries the **AaBb** genes for melanin and would be “middle brown” in skin shade. Now, if two people carrying the **AaBb** genes got married and reproduced, their children could have a wide range of skin colors.” (Source: <https://answersingenesis.org/racism/adam-eve-all-skin-tones/>)

This explains how Adam and Eve could have all the skin colors. But if you look closely, you see that if they only had one child, the other **A**, **a**, **B**, and **b** genes are lost. That’s fine right now, but when the child passes the ‘**A**’ and ‘**b**’ genes. Genes ‘**a**’ and ‘**B**’ are lost (example: **AABB** + **aabb**. The red information is lost, even though there is still the other of that pair, that specific one is gone]). Do you see how this works? Theoretically you could have enough children to pass off all your genes, but as you can see today—that is not happening.

This is very basic genetics. I don’t know if you have ever studied genetics, but this is the basics. You can get mad at me for “dumbing this down” for you, but so be it. It makes things easy.

Another example of information loss: pretend for a moment that gene L is the long hair gene in dogs, and gene s is short hair. A pair of dogs in the desert have genes **LLLL** and **ssss**. Their off spring have a mix of those genes (**LsLL**, **ssLs**, **LsLs**, **LssL**, and others). **LLLL** is the longest hair a dog can have. **ssss** is the shortest. The dog with **LsLL** is going to be hot. And since it is hot, it won't survive as well. Thus, **LsLL** dog dies. The gene **L** is not passed down from that dog. The dog **ssLs** has shorter hair, it does well in the heat. It reproduces.

After a while you have mostly s genes. The L genes don't work as well in the desert, so they die off. The same thing happens in a very cold climate. The short hair dogs die, leaving the long haired to survive and reproduce. The L genes succeed, the s genes die.

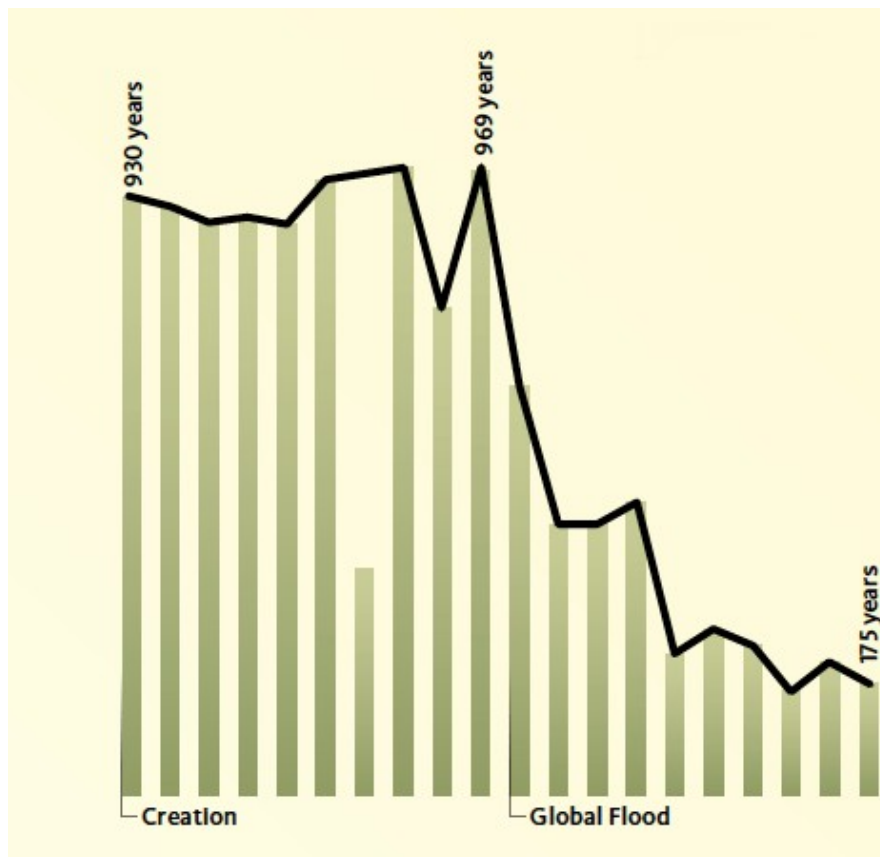

This makes it sound like things are getting better, right? Well yes and no. Things have adapted, but genetic information is lost.

<https://answersingenesis.org/natural-selection/speciation/speciation-yes-evolution-no/>

Things adapt, they don't evolve. And adapting means losing the unhelpful information. And luckily God gave everything enough information to be able to adapt.

This is the exact opposite of evolution. Devolution.

BIBLICAL EVIDENCE

Note that the flood “somehow” shortened the lifespans of every person thereafter.

I can explain this.

You said that life spans might have had something to do with food. (And some tiny bits could have something to do with food. But food is not the key to get back to 800+ years of life)

“The world changed significantly due to the Flood. Vegetation, as well as land and sea life, were drastically reduced and made to virtually

“start all over again.” But did this cause aging to significantly drop off? Noah, who was already 600 years old, stepped off the Ark into this new world as well. If the environment was the cause of the reduced age, why did Noah live 350 more years?” (Source: <https://answersingenesis.org/bible-questions/why-did-people-have-shorter-lives-after-flood/> please look at this link.)

350 years is quite a bit. Also, Shem made it to 600 years old! So food is probably not the cause.

If you still don’t believe genetics can affect our life spans look at this:

<https://answersingenesis.org/biology/disease/one-tiny-flaw-and-50-years-lost/>

“Imagine waking up every morning having aged five days while you slept. In about 13 years, you would come to the end of your life. There is a children’s disease with similar effects, called Hutchinson-Gilford progeria syndrome (HGPS).”

Let’s look at brain power! (<https://answersingenesis.org/technology/is-man-getting-smarter/>)

“We live in a technological age. We see incredible inventions all around us that have been mastered since the Industrial Revolution. We have computers, phones, radar, heart stents, cars, jets, spaceships (and a space station!), and let’s not forget the brilliant invention called. .

. air conditioning! We might be tempted to say that man is getting smarter because we have all these great inventions and new gadgets at our fingertips. But are we? I suggest we need to exercise caution on this subject.”

This study found that the IQ of man is dropping:

<http://www.sciencedirect.com/science/article/pii/S0160289613000470>

You said you think that we are getting better and better. Well, I disagree. (And this is not something that lets me “feel happy about myself.” In fact, it’s the opposite.)

<https://answersingenesis.org/genetics/mutations/evolution-is-just-mistakes/>

“The problem for evolutionists is that the only beneficial mutations ever observed by humans do not add new information to the genome; they merely reshuffle or, sometimes, delete genetic information. That may still lead to a mutant creature, but it’s quite the opposite of the changes Darwin had in mind. Rather than fish gaining weight-bearing limbs and lungs, commonly cited examples of “evolution” have cave fish losing their eyes. Obviously, such a process could go on forever and fish would never turn into philosophers; fish would continue to be fish, being at most an “ultra-simplified” fish.”

“. . . [E]ven when an “advantageous mutation” becomes fixed in a population, the mutation is not producing new genetic information and, more importantly, the mutation—no matter how fixed—is not producing a new creature or a transitional creature, just a fruit fly better adapted for its environment at the time.”- <https://answersingenesis.org/genetics/mutations/fruit-flies-advantageous-mutations/>

Don’t be afraid to look here: <https://answersingenesis.org/genetics/animal-genetics/as-i-always-said-its-a-mutant/>

CONCLUSION

Evolutionist, and some people I know, hate to admit that we are losing genetic information. For me, it hurts. I hate knowing that I am less evolved than those who came before me. But it is true. Evolutionist try to find ways around it, some people deny it, but it is the truth. The physical word shows this. This is all part of the curse.

There are some people who say we must have gained information. But that's based off of their evolutionary world view.

“Most people lose the ability to digest milk by their teens. A few thousand years ago, however, after the domestication of cattle, several groups of people in Europe and Africa independently acquired mutations that allow them to continue digesting milk into adulthood. Genetic studies show there has been very strong selection for these mutations, so they were clearly very beneficial.”

This person has no proof. He's just saying things.

In my experience, people point to two things they say must be related, then point out the things that must have been gained for the creature to change to the other.
