

WHAT IS EVERYTHING?

Lanthano

3-14-2025

Does this world have a beginning? If there was a beginning, was it natural or God? To try and find out what is true, we will attempt to break things down and simplify things. Once, that is done, we will apply simple logic and find out what answers fit best.

If something cannot be simplified, or will only simplify at the cost of correctness, it will be left in it's complicated state. The goal of this paper is the truth. Simplicity will be imposed only when it makes sense.

BEGINNING AND END

First things first. Does this world have a beginning or an end? There are four possibilities:

1. **The world had no beginning, and no end.**
2. **The world had a beginning, but no end.**
3. **The world had a beginning, and end.**
4. **The world had no beginning, but will end.**

END

With the information we have today, one thing that just about everyone agrees on, is that this world will have an end.

A commonly cited proof that the universe is winding down comes from the Second Law of Thermodynamics, which shows that entropy in a closed system must increase over time. Because the universe behaves like an isolated system, energy naturally spreads out and becomes less useful for doing work.

Observations such as the expansion of space confirm that matter and energy are dispersing rather than concentrating. This forms a strong theoretical and observational basis for the idea that the universe is gradually moving toward a state of maximum entropy, often called Heat Death of the Universe.

- **Thermal diffusion:** In any isolated system, heat flows from hotter regions to colder regions until temperature equalizes. For example, a hot metal block in a cooler room will eventually reach the same temperature as the surroundings, showing that usable energy spreads out.
- **Spontaneous mixing:** Liquids or gases, like cream in coffee or gas molecules in a container, naturally mix and never unmix on their own. This demonstrates that systems evolve toward disorder without external intervention.

These processes are ubiquitous and unavoidable, applying to almost every natural system, making them a fundamental proof that energy becomes less organized over time, independent of space or cosmic expansion.

Someone could argue that the world just ebbs and flows. It has highs and lows in energy and that we only see it going down before it will go up. If you want to believe this idea, that's fine. But it seems to me to be more logically sound to assume that the world does in fact work as we see things now.

This means that we can reasonably infer that the world around us will have an end of sorts.

BEGINNING

The biggest proof that the world had a beginning is oddly enough the fact that it will have an end. If the world is slowly decaying, then it can be inferred that if you travel back in time, the world becomes more and more organized. However, this cannot go on for infinity. There is a limit to the perfection, and once set, we see the system decaying.

If the universe has an end, it logically implies it must have had a beginning. Any temporal process that reaches a final state requires a starting point; an end cannot exist in isolation without something that precedes it.

In physics, we see this principle reflected in cosmology: the universe is expanding and heading toward eventual heat death or another ultimate fate, which presupposes a finite timeline.

This mirrors the logical structure of the two laws of thermodynamics: the first law establishes that energy in a closed system is conserved, giving the universe a defined total "content," and the second law drives energy toward disorder, ensuring that processes move from a low-entropy beginning to a high-entropy end. Together, they show that a universe with an end necessarily had a structured, energetic beginning.

So assuming that the world will have an end, also infers that the world had a beginning.

CONCLUSION

From the logic applied, it seems reasonable to conclude that the world had a beginning, and will have an end. Leaving the other three options void of reasonable evidence.

NATURE OR GOD

Now we are going to try and use logic to figure out if the beginning of this world was a natural occurrence, or of a god (god here refers to any god, it does not automatically imply the God of the Bible or any other religion. It also does not refer to a single god.).

Here, the only option sits outside our realm:

- 1. Supernatural being or cause beyond this realm (quantum fluctuations, multiverse, unknown principle or law, simulation theory, God, gods, or other creators)**

SUPERNATURAL

The reason that the multiverse, and simulation theory get put into this category, is this: all these options agree that the cause of this world is outside this system.

If one man says that this world is a simulation, and another man argues that a god created everything. The god of one is the mighty programmer of the other, and the mighty programmer is the god of the other. By it's very nature, everything inside this category is effectively the same thing. Because it requires verification outside the system we live inside of.

Quantum fluctuations goes inside this option as well.

This idea says that something at the quantum level could be responsible for creating our world. This makes it possible for there to be an unending cycle of worlds being created and ending.

Sure, this idea could be disproven in the future. Due to this being something that we could test inside this realm with quantum physics. But theoretically, it is possible that the beginning of this world:

- Relied on mechanisms governed by physical laws.
- They are self-contained, do not require anything outside the system, and follow the principle of causation as we observe it in nature.

But this leads to another question (and this is why this is also outside our realm). If the quantum realm made our world while already existing, that's not when this universe truly began.

If the quantum realm existed before our world began, it goes into the Supernatural category. If it didn't start with ours, then it requires observations outside our system of reality.

CONCLUSION

All available evidence indicates that this world began as a simulation, or was created or started by God, gods, or supernatural abstract physics. This indicates that the conceptual idea of God cannot be disproven.
