

THE MARS HOAX

By Lanthano February 23, 2024

WHY WOULD THE GOVERNMENT LIE TO YOU? The answer is very simple, power and money. It is undeniable that the space program has brought in billions¹ for the government. While this is a very plausible reason for NASA to fake the Mars missions, it doesn't mean that they did.

The motivation doesn't prove the crime.

PHOTOGRAPHIC ANOMALIES

The main picture displayed above is an official NASA photograph. It is not fake or edited.

To the right you can see two photos. The first photo shows what seems to be small creature hiding among the rocks¹. This is a small section that has been taken from the larger picture displayed above.

The second photo is of an Arctic Lemming.

Do the creature-like shapes in the two pictures look similar? NASA says that the creature-shaped thing in the first photo is just another rock. Those who believe it to be an Arctic Lemming, are sometimes told that they are merely experiencing something called pareidolia².

Pareidolia is seeing a resemblance to something, when there is none. But, look again. Is that pareidolia, or is that actually an Arctic Lemming?

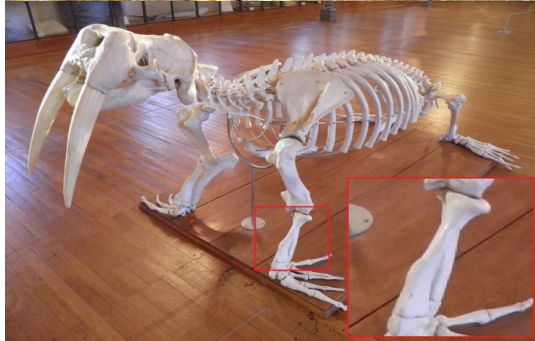

Here's something to test: if you were shown those two pictures, and it had nothing to do with NASA, would you think the first shape resembled the lemming?

Next up for photographic anomalies, we have a bone⁴. Or a rock—that really, really looks like one.

NASA claims that it is a rock formed by erosion, in the form of water or wind. They also say that they don't expect life to have ever existed on Mars, and if it did, it would have been microbes⁵. So a bone is impossible, or as they put it, not likely.

So, you are left with three options. One, that is just another rock. Two, that is a bone and there must be life on Mars. Or three, that is a bone, but a bone here on earth.

My reasoning tells me that it being a bone here on earth is the most plausible.

This bone has even been (unofficially) identified. Some claim that it is the leg bone of a Walrus. I'll let you make your own decision.

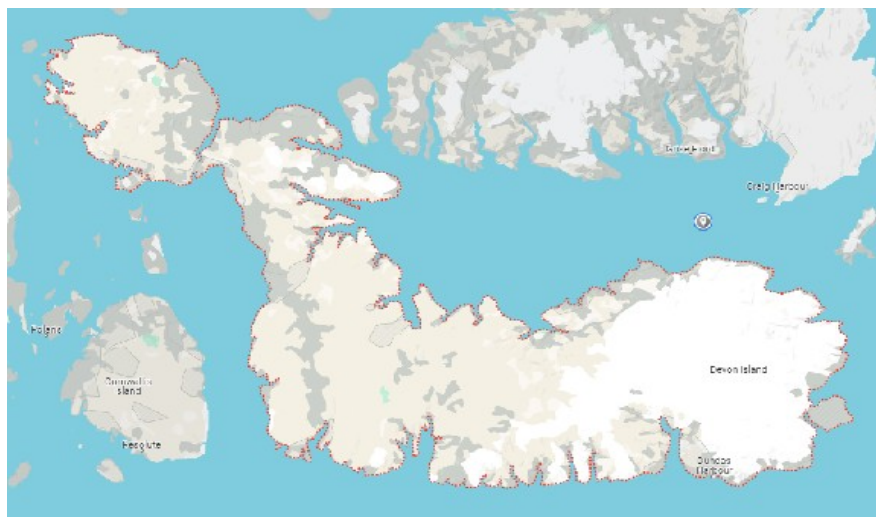

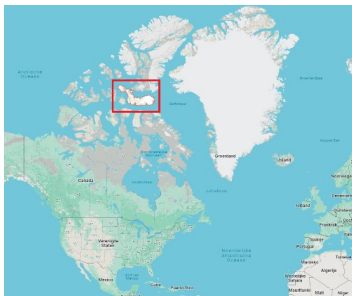

If you think that is a bone, you could also be accused of pareidolia. Seeing a shape or pattern that isn't there.

Now, what is a lemming and a bone prove? It proves that the pictures were taken on earth, faked on earth. That is, unless you believe that they are just really cool rocks.

LOCATION

This is all very good and all, but what happens if I know of a spot where NASA is filming the Mars rover footage? It would have to be backed up and supported by this former evidence. And as far as I can tell, it does.

Devon Island is the world's largest uninhabited island. NASA actually uses a crater on the island to simulate a field test for the Mars rovers⁶.

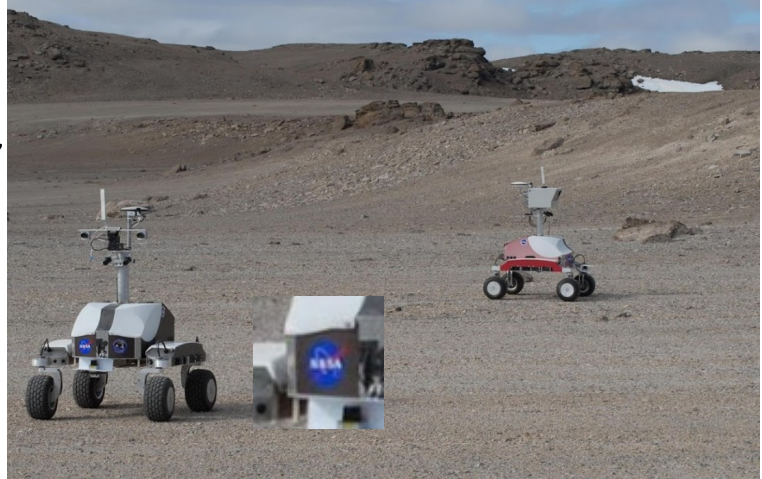

This is where Scott C. Waring thinks NASA fakes their Mars footage. He believes that NASA puts a red filter on the photographs and videos. Which honestly, would be no problem to do.

The Arctic Lemming we talked about earlier, is native to the area⁷. So if this is where NASA is faking footage, this would make more sense. The Walrus is also native to the area⁸.

To the right, you can see a picture taken from Google Maps. It shows what appears to be two rovers.

NASA does indeed have a presence in this island. The only question is whether or not NASA is as trustworthy as they make themselves out to be.
